

Video recording for TRAM, etc.

ACTIA BOP HD-Controller

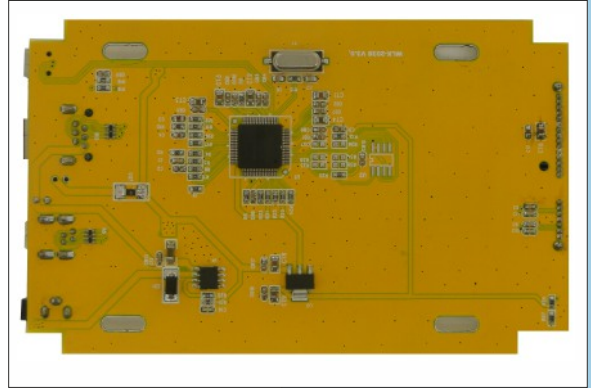

Redesign

The original HD controllers of the video recording devices from the manufacturer ACTIA, for TRAM and buses, are no longer available. The key components, SATA host adapters JMB 353 from the manufacturer JMicron, are obsolete.

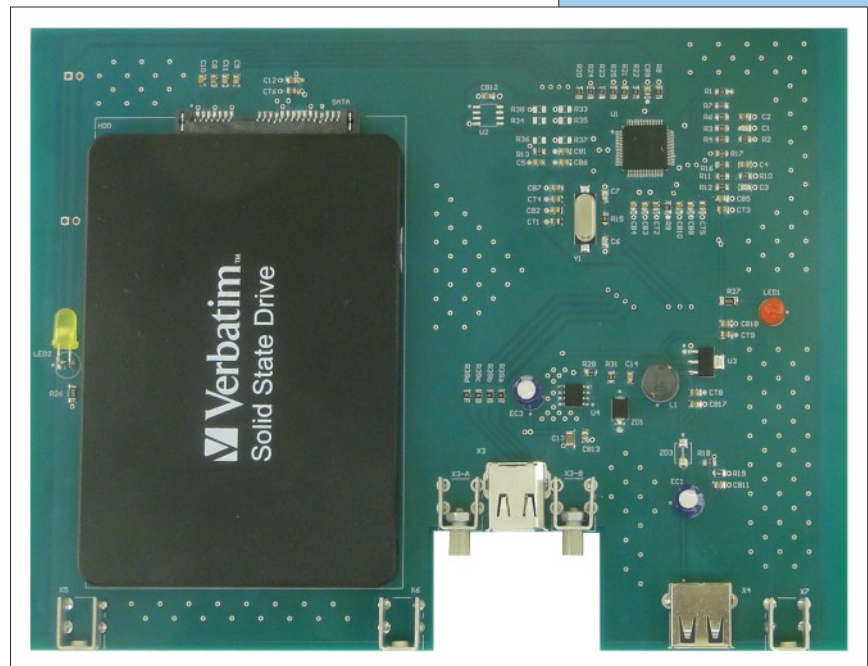

The fully plug-and-play compatible redesign replaces the obsolete original assembly, as the complete device with interfaces, connectors and front panel in the BOB video protection system is replaced.

On the controller board, the plug-in unit also carries the HD (SDRAM), with the memory capacity of 80-500 GB required for the application.

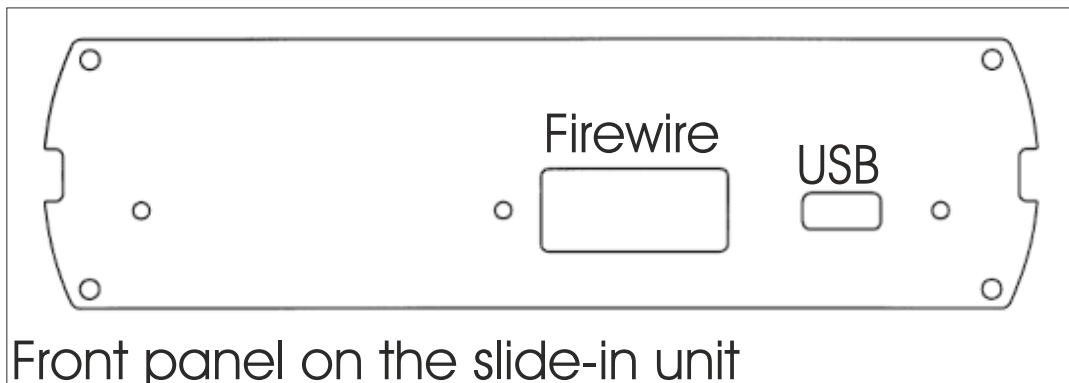

The plug-in unit also replaces the front panel in the original BOB housing and Firewire and USB connections are in the same place.
